Introduction to High-Performance Computing **Exercise**

Giorgio Amati

Corso di dottorato in Ingegneria Aeronautica e Spaziale 2024

g.amati@cineca.it / g.amaticode@gmail.com

Agenda

- ✓ Simple “warm-up” exercise: Matrix-Matrix Multiplication
- ✓ Complete the code
  - Fortran/C
- ✓ Check the results
- ✓ Extract some Performance figure (in MFLOPs)

You can use:

- ✓ Any available HW
- ✓ Any available Compiler
- ✓ Any compiler option

How to do

- ✓ Clone the repository
  - `git clone https://github.com/gamati01/HPCLessons.git`

```
.

│   ├── mm.c
│   ├── mm.F90
│   ├── mod_tools.F90
│   └── README
├── LESSON1
│   ├── HPC-1.pdf
│   └── HPC-1-spoiler.pdf
└── README.md
```

✓ Complete the code

```
70 ! main loop
71 call system("date     > time.log")
72 call timing(time1)
73 !
74 ! write bottom here 3 nested loops....
75 !
76                c(i,j) = c(i,j) + a(i,k)*b(k,j)
77
78 call timing(time2)
79 call system("date     >> time.log")
```

compile.fortran.sh

- ✓ simple script to compile the code
- ✓ choose the available compiler & compiler options

```
rm -rf *.o mm.x *.mod
#
…
#
# gfortran (GNU)
COMP=gfortran
OPT=
#
echo "compiling with " $COMP $OPT
#
$COMP $OPT mod_tools.F90 -c
$COMP $OPT mm.F90 -c
$COMP $OPT mod_tools.o mm.o -o mm.x
#
echo "That's all folks!!!"
```

./mm.x

✓ If correctly code it should give an output like that

```
 ---------------------------------------
  Matrix-Matrix Multiplication
  precision used              15
  rel. 0, naive multiplication
  Which matrix size?
1024
  Matrix size       =         1024
  Memory size (MB) =          24
 ---------------------------------------
 initialization   1.1718750000000000E-002
   0.4293334354359644         0.9410485065499756       0.00000000000000
 ----------------------------
 CPU:time for moltiplication  3.140625000000000
 CPU:MFLOPS                   683.7758861940298
 CPU:check                    257.1789318419338
```

✓ size (e.g. 1024) given by standard input

✓ check ~ size/4

✓ Complete the code

```
45    time1 = clock();
46    /*                                */
47    /* write here 3 nested loop       */
48    /*                                */
49                c[i][j] = c[i][j] + a[i][k]*b[k][j];
50
51
52    time2 = clock();
```

compile.c.sh

- ✓ simple script to compile the code
- ✓ choose the available compiler & compiler options

```
rm -rf *.o mm.x *.mod
#
…
#
# gcc (GNU)
COMP=gcc
OPT=
#
echo "compiling with " $COMP $OPT
#
$COMP $OPT mm.c -c
$COMP $OPT mm.o -o mm.x
#
echo "That's all folks!!!"
```

./mm.x

✓ If correctly code it should give an output like that

```
================================
double precision
size 1024
================================
Initialization
Elapsed time for initialization
Total time -----------------> 0.020759
================================
Tme ------------------> 2.280420
Mflops ----------------> 941.705321
Check -------------> 252.884160
```

✓ size (e.g. 1024) hard-coded in the code

✓ check ~ size/4

Homework: Fill the table

Size	Fortran	C
1024*1024		
2048*2048		
4096*4096		
8192*8192		

- ✓ Compiler used:
- ✓ Compiler option used:
- ✓ HW used:

my homework: `gnu` compiler

Size	Size MB	Fortran MFlops (time)	C Mflops (time)
1024*1024	24	14’800 (0.15”)	14’300 (0.15”)
2048*2048	96	6’500 (2.64”)	6’500 (2.66”)
4096*4096	384	6’100 (22.6”)	6’200 (22.1”)
8192*8192	1536	6’000 (184”)	6’100 (180”)

- ✓ Compiler used: **`gfortran/gcc`** (rel. 11.4.0)
- ✓ Compiler option used: **`-Ofast`**
- ✓ HW used: AMD Ryzen 5 5625U with Radeon Graphics

my homework: `nvidia` compiler

Size	Size MB	Fortran MFlops (time)	C Mflops (time)
1024*1024	24	19’000 (0.11”)	15’000 (0.14”)
2048*2048	96	6’600 (2.69”)	6’200 (2.79”)
4096*4096	384	5’900 (23”)	5’500 (25”)
8192*8192	1536	5’800 (189”)	4940 (222”)

- ✓ Compiler used: **`nvfortran/nvc`** (rel. 23.11)
- ✓ Compiler option used: `-O3`
- ✓ HW used: AMD Ryzen 5 5625U with Radeon Graphics

my homework: `intel` compiler

Size	Size MB	Fortran MFlops (time)	C Mflops (time)
1024*1024	24	8’000 (0.26”)	12’500 (0.17”)
2048*2048	96	5’000 (3.4”)	5’400 (3.15”)
4096*4096	384	4’700 (29”)	5’100 (27”)
8192*8192	1536	4’600 (239”)	4’800 (231”)

- ✓ Compiler used: **`ifx/ifc`** (rel. 2024.0.2)
- ✓ Compiler option used: **`-O3`**
- ✓ HW used: AMD Ryzen 5 5625U with Radeon Graphics

mm.F90 & mm.c

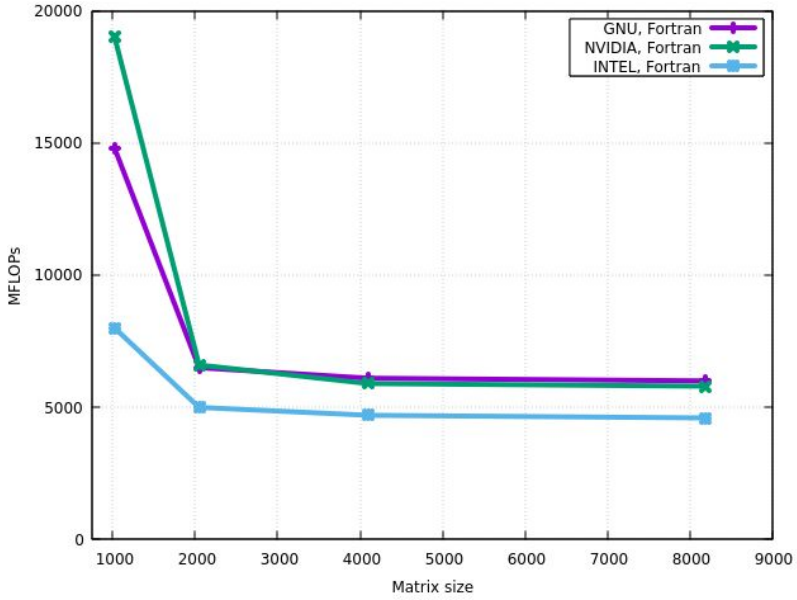
✓ Fortran

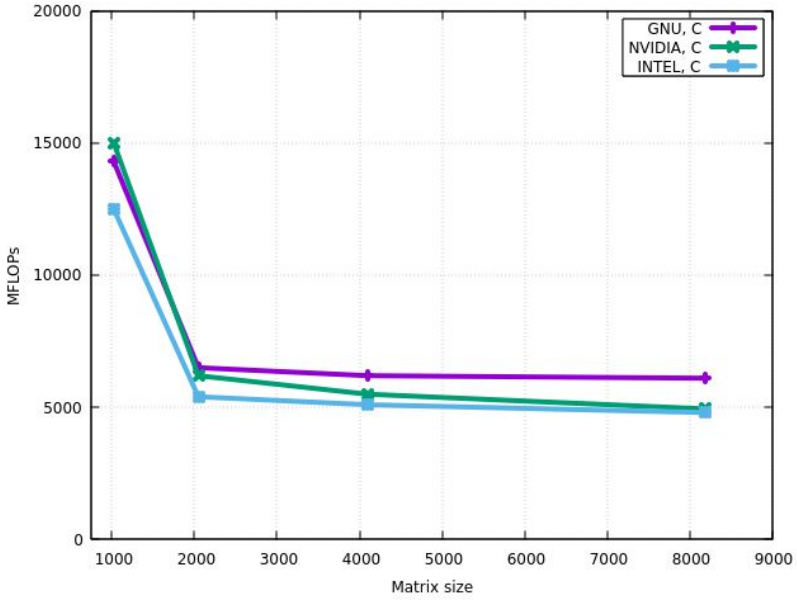
```
76  do k = 1, n
77       do j = 1, n
78            do i = 1, n
79                 c(i,j) = c(i,j) + a(i,k)*b(k,j)
80            enddo
81       enddo
82  enddo
```

✓ C

```
46 for (i = 0; i < nn; i++)
47       for (k = 0; k < nn; k++)
48            for (j = 0; j < nn; j++)
49                 c[i][j] = c[i][j] + a[i][k]*b[k][j];
```

Results





- ✓ Fortran (left) vs. C (right)
- ✓ Any idea of the reason of this behaviour?
